

साधक

Saadhak

Most AI trading agents are confident. This one is calibrated.

An autonomous, defined-risk options agent on Alpaca that earns its position size by proving it knows what it knows.

TEAM SAADHAKA • LABLAB.AI × ALPACA
• PAPER ACCOUNT PA36JVGLDYR4

THE PROBLEM

Confidence is not accuracy

- A language model will tell you it is 90% sure.

Nothing scores that claim.

Nothing changes if it turns out to be wrong.

So the number is decoration, and the size behind it is a guess.

Saadhak makes the claim falsifiable, scores it, and lets that score decide the money.

THE STRATEGY

Defined risk, every time

- Iron condors and vertical spreads, profiting when the market stays in a range.

one day to expiry, on liquid index products

never naked, never a market order

the maximum loss is known before the order goes in

ARCHITECTURE

Three components

NIYAMA

the discipline.
Deterministic code.
Searches 70 structures per name.
The only thing that can create an order.

SAADHAKA

the practitioner.
A Featherless model over Alpaca's MCP server. 33 research tools, none mutate. May veto, never start.

SAAKSHYA

the witness.
Scores every probability, reconciles the broker through the Alpaca CLI.

SAFETY

Nineteen gates before an order

GROUP

WHAT IT CHECKS

market state

hours · days to expiry · reconciled · kill switch

risk appetite

whitelist · max loss · portfolio caps · halts · sizeable

measurement

expectancy — a 2× stop against a half-credit target needs a 2-in-3 win rate

quality

defined risk · liquidity · deltas · idempotent id · limit only · exits

circuits

earnings guard · regime breaker · correlation

THE IDEA

What earns the size

- Every review states a probability. The witness resolves it against what happened.

90% claimed and right half the time means the budget is cut

the engine sets the band, so a wider guess cannot buy a better score

Brier 0.248 over 40 · says 48%, right 57% → 0.70× of full size

CONTROL

It knows when to stop

- Two consecutive stop-outs block new entries in that name.
- SPY and QQQ correlate at **0.91** — one position, not two.
- A 3% daily loss halts entries; 6% flattens everything.

exits keep running through a halt — it never traps a position

THE STACK

Every Alpaca surface, plus Featherless

Trading API multi-leg limit orders, signed negative for credit

Market Data chains, bars, quotes, news — greeks solved locally at 0 DTE

MCP server the practitioner's research, trading toolset withheld

CLI reconciliation, kill switch, health checks, dry-runs

Featherless open-weight models behind an OpenAI-compatible endpoint

RESULTS

Honestly

- Four positions across two sessions. Three stopped out when the index trended.

the account finished at \$99,212 — down \$788

every loss capped at exactly one credit

no structure exceeded its stated maximum

Two sessions is not a track record. This demonstrates a mechanism.

DISCLOSURE

What it rests on

- Alpaca's free data tier: IEX quotes, indicative option quotes, 15-minute SIP delay.

every decision records its data provenance and marks degraded inputs

a stock moved 8% between our last visible print and the truth

- Calibration rests on tens of forecasts, not thousands.

Thank you

for taking the time to go through this agentic demo.

The model proposes. The discipline decides. **A witness keeps score.**
